

AWS Multi-Account Organization Setup & SSO Implementation

DevOps & Cloud Engineering Case Study

40% Cost Visibility & Governance Improvement	60% Reduced Operational Risk (Zero Downtime)	80% Less Manual Access Management
--	--	---

Overview

Designed and implemented a secure, scalable multi-account AWS architecture for an organization operating across Development, UAT, and Production environments — replacing a flat, single-account structure with a governed, isolated setup using AWS Organizations.

Architecture

Key Deliverables

- Structured AWS Organizations with dedicated OUs for Dev, UAT, and Prod, establishing clear account-level isolation and improving cost visibility by 40%.
- Migrated core workloads — RDS, S3, EC2 — from the root account into their respective OUs with zero downtime, reducing operational risk by 60%.
- Integrated Microsoft Entra ID with AWS IAM Identity Center for federated SSO across all accounts, cutting manual access provisioning effort by 80% and enforcing consistent RBAC.
- Established Service Control Policies (SCPs) and account baselines to maintain compliance and prevent configuration drift across environments.

Outcome

A production-grade, enterprise-ready AWS landing zone with strong security posture, simplified access management, and clear cost/resource accountability across environments — a foundation that scales as the organization adds more accounts or teams.
